Utility and Methods of Administration

General Utility

The compounds of this invention are useful for treating mammals having a variety of vascular disease states, and have protective activity against some of the deleterious effects resultant upon cerebral ischemia. Disease states that may be treated include stroke, migraine, epilepsy or epileptic psychotic symptoms, hypertension, angina, arrhythmia, thrombosis, embolism, acute cardiac failure, irritable bowel syndrome, neurodegenerative diseases such as Alzheimer's or Huntington's chorea, diuresis, ischemia such as focal and global ischemia or cerebrovascular ischemia induced by cocaine abuse. The compounds of this invention are also useful for treating spinal injuries, and are particularly useful for treating cerebrovascular disease states, for example, stroke.

Generally, vascular disease states are found in mammals, including: domestic commercial animals such as horses, cattle, sheep and pigs; domestic house animals such as dogs, cats, and the like; and particularly humans.

Activity Testing

Activity testing for treating stroke, migraine, epilepsy or epileptic psychotic symptoms, hypertension, angina, arrhythmia, thrombosis, embolism, acute cardiac failure, irritable bowel syndrome, neurodegenerative diseases such as Alzheimer's or Huntington's chorea, diuresis, ischemia such as focal and global ischemia, cerebrovascular ischemia induced by cocaine abuse, or spinal injuries can be undertaken in vitro and/or in vivo using assay procedures known in the literature. The following are examples of such assay procedures.

Activity for treating vascular disease states can be determined in vitro by determining selective vascular relaxant activity, and in vivo by determining general cardiovascular activity.

In vitro calcium antagonistic activity of the compounds of this invention is determined by an assay using rat aortic strip, which is a modification of that described by R. Kent, et al., Federation Proceedings, 40, 724 (1981). Cerebrovascular selectivity of action is determined by comparing potencies on rabbit basilar artery and rabbit ear artery using a modification of the procedure described by R. Towart, et al., Arzneim. Forsh., 32(I), 338-346 (1982).

In vivo protective effects of the compounds of this invention against the deleterious effects of cerebral ischemia are determined by use of the standard gerbil brain ischemia model. This assay is a modification of that described by T. Kirino, Brain Res., 239, 57-69P (1982).

General Administration

The compounds of this invention are administered at a therapeutically effective dosage, i.e., a dosage

sufficient to provide treatment for the disease states previously described. Administration of the active compounds and salts described herein can be via any of the accepted modes of administration for agents that serve similar utilities.

Generally, a daily dose is from 0.02 to 50 mg/kg of body weight per day of the active compound of Formula A. Most conditions respond to treatment comprising a dosage level on the order of 0.1 to 4 mg/kilogram of body weight per day. Thus, for administration to a 70 kg person, the dosage range would be about 1.4 to 3500 mg per day, preferably about 7.0 to 280 mg per day.

Depending on the specific disease state, administration can be via any accepted systemic route, for example, via parenteral, oral, intravenous, or nasal routes, in the form of solid, semi-solid or liquid dosage forms, such as for example, tablets, suppositories, pills, capsules, powders, solutions, suspensions, aerosols, emulsions or the like, preferably in unit dosage forms suitable for simple administration of precise dosages. The compositions will include a conventional pharmaceutical carrier or excipient and an active compound of Formula A and, in addition, may include other medicinal agents, pharmaceutical agents, carriers, adjuvants, etc.

If desired, the pharmaceutical composition to be administered may also contain minor amounts of non-toxic auxiliary substances such as wetting or emulsifying agents, pH buffering agents and the like, such as for example, sodium acetate, sorbitan monolaurate, triethanolamine oleate, etc.

The compounds of this invention are generally administered as a pharmaceutical composition which comprises a pharmaceutical excipient in combination with a compound of Formula A. The level of the drug in a formulation can vary within the full range employed by those skilled in the art, e.g., from about 0.01 weight percent (w%) to about 99.99 w% of the drug based on the total formulation and about 0.01 w% to 99.99 w% excipient.

Oral Administration

The preferred manner of administration, for the conditions detailed above, is oral using a convenient daily dosage regimen which can be adjusted according to the degree of affliction. For such oral administration, a pharmaceutically acceptable, non-toxic composition is formed by the incorporation of the compound of formula A in any of the normally employed excipients, such as, for example, pharmaceutical grades of mannitol, lactose, starch, magnesium stearate, sodium saccharine, talcum, cellulose, glucose, gelatin, sucrose, magnesium carbonate, and the like. Such compositions take the form of solutions, suspensions, tablets, pills, capsules, powders, sustained release formulations and the like. Such compositions may contain between 0.01 wt% and 99.99 wt% of the compound of Formula A, but preferably such compositions will contain between 25 wt% and about 80 wt%.

Preferably the compositions will take the form of a pill or tablet and thus the composition will contain, along with the active ingredient, a diluent such as lactose, sucrose, dicalcium phosphate, and the like; a disintegrant such as starch or derivatives thereof; a lubricant such as magnesium stearate and the like; and a binder such as a starch, polyvinylpyrrolidone, gum acacia, gelatin, cellulose and derivatives thereof, and the like.

Suppositories

For systemic administration via suppository, traditional binders and carriers include, for example, polyalkaline glycol or triglycerides [e.g., PEG 1000 (96%) and PEG 4000 (4%)]. Such suppositories may be formed from mixtures containing active ingredients in the range of from about 0.5 wt% to about 10 wt%; preferably from about 1 wt% to about 2 wt%.

Liquids

Liquid pharmaceutically administerable compositions can, for example, be prepared by dissolving, dispersing, etc. an active compound (about 0.5% to about 20%), as described above, and optional pharmaceutical adjuvants in a carrier, such as, for example, water, saline, aqueous dextrose, glycerol, ethanol and the like, to thereby form a solution or suspension.

Actual methods of preparing such dosage forms are known, or will be apparent, to those skilled in this art; for example, see Remington's Pharmaceutical Sciences, Mack Publishing Company, Easton, Pennsylvania, 16th Ed., 1980. The composition to be administered will, in any event, contain a quantity of the active compound(s) in a pharmaceutically effective amount for relief of the particular condition being treated in accordance with the teachings of this invention.

Methods of Preparation

The compounds of this invention can be made as shown in Reaction Schemes I to VI, wherein R¹, R², R³, R⁴, and R⁵ have the same meaning as set forth above in the Summary Of The Invention, and X is halo.

REACTION SCHEME IStep I-AStep I-BI. Preparation of Formula A Where R³ is Hydrogen

Referring to Reaction Scheme I, in Step I-A a mixture of a compound of Formula 1 with an inert hydrocarbon solvent (for example, benzene, toluene, chloroform and the like) is refluxed with a slight excess of a halogenating agent, for example, a thionyl halide (such as thionyl chloride), to produce the corresponding alkyl halide derivative, compound of Formula 2. Compounds of Formula 1 are obtained by reacting the appropriate amidine with the appropriate dione using the procedures of Dziuron and Schunack [Arch. Pharm., 306, 347 (1973) and Arch. Pharm., 307, 46 (1973)] Imbach, et al Bull. Soc. Chim. France, 3 1059 (1971), Cornforth and Huang, J. Chem. Soc., (1948) 731-735, Ewins, J. Chem. Soc., 99 2052 (1911), of U.S. patent 4,107,307. The reaction is conducted at a temperature from about 0°C to the reflux temperature of the solvent, but preferably between about 40°C and 65°C.

In Step I-B, the compound of Formula 2 is condensed with a compound of Formula 3, for example, at a temperature from about 25° to 80°C, preferably at the reflux temperature of the solvent system used.

The 1-substituted piperazines of Formula 3 are commercially available or can be made by the procedures of Hamlin, et al., J. Am. Chem. Soc., 71, 2731 (1949) or Cheeseman, J. Chem. Soc., (1975), 115-123. Diazepine analogs (i.e., those compounds where m is 3) can be made by this method using diazepine as the starting material instead of piperazine. An alkaline solution is made by dissolving a compound of

Formula 3 in a polar solvent (for example, methanol, ethanol, or a mixture such as ethanol and water, methanol and water, acetone in water, dimethylformamide in water, isopropanol in water, tetrahydrofuran in water; in the ratio of from about 10:90 to about 90:10, preferably about 60:40), and adding a base (such as sodium hydroxide, potassium hydroxide, sodium carbonate, sodium bicarbonate, potassium carbonate, potassium bicarbonate, and the like). The alkaline solution is heated to reflux.

A solution of the compound of Formula 2 dissolved in the same polar solvent is added dropwise to the refluxing solution of the compound of Formula 3. After about 1 to 24 hours, preferably about 2 to 5 hours, the condensed product of Formula A' is separated from the reaction mixture either by precipitation or evaporation under reduced pressure. The reaction mixture is allowed to stand at room temperature, for example, for about 8 to 24 hours, preferably overnight. If the product precipitated, the resulting crystals are removed by filtration and recrystallized in an alcohol, preferably methanol or ethanol giving the free base of Formula A'. If the product is an oil, the oil is washed with water and dissolved in diethyl ether. Acid is added and the product is precipitated as the acid addition salt using ethanol.

The free base can be converted to the salt by dissolving the free base in a suitable organic solvent, such as ethanol or ether, and extracting with acidic aqueous solution. The use of heat may be required to dissolve the free base, depending upon the acid chosen.

The salt can be converted back to the free base by suspending it, for example in ether, and adding an excess of a dilute aqueous base, such as potassium carbonate, until the salt dissolves. The organic layer is separated, washed with water, dried and evaporated to yield the free base.

The salt of a compound of formula A can be converted to another salt by methods known in the art for interconversion of salts.

REACTION SCHEME II

Step II-A

Step II-B

Step II-C

II. Preparation of Formula A Where R^3 is Methyl and n is 0

15 Referring to Reaction Scheme II, in Step II-A a compound of Formula 4 [obtained using the procedure of Vecchio, et al., *Chim. Ind. (Milan)*, 58(6), 451 (1976) or of Haruki, et al., *Nippon Kagaku Zasshi*, 86(9), 942-946 (1965) (Japan)] is reduced by contacting it with a reducing agent, such as a hydride (for example, potassium borohydride, or lithium aluminum hydride) in an alcoholic solution (for example, methanol, ethanol, isopropanol, and the like). The solution is stirred for about 2 to 16 hours, e.g., overnight, and the resulting solid material, of Formula 5, is removed by filtration (using reduced pressure if necessary), washed, dried and used in the next step without further purification.

20 In Step II-B, the crude compound of Formula 5 is dissolved in an inert solvent (for example, chloroform, dichloromethane, benzene, toluene, and the like). A halogenating agent, such as thionyl chloride, is added to the solution and the resulting mixture is heated at reflux for a period of time between 1 and 10 hours, preferably between about 4 and 6 hours. After cooling, the solvent is removed under reduced pressure and the residue is triturated in acetone to give a compound of Formula 6.

25 In Step II-C, the compound of Formula 6 and a compound of Formula 3 are reacted together under the conditions described in Step I-B to give a compound according to Formula A^2 . An oil product may be separated, dissolved in ether, and acidified to precipitate. The reaction time is about 1 to 24 hours, preferably about 4 to 5 hours.

REACTION SCHEME IIIIII. Preparation of Formula A Where R³ is Hydroxyl and n is 2

Referring to Reaction Scheme III, in Step III-A a methyl ketone, such as a compound of Formula 4, an amine, such as a compound of Formula 3, and formaldehyde are reacted together under the conditions typically used for a Mannich reaction, to give a compound of Formula 7. Thus, the ketone of Formula 7 is dissolved in a solvent such as water, methanol, ethanol, or acetic acid and formaldehyde is introduced. The amine is then added and the reaction mixture is refluxed. If necessary a small amount of an acid such as hydrochloric acid, may be introduced to assure that the reaction mixture is not basic.

In Step III-B, the compound of Formula 7 is reduced under conditions similar to those described in Step II-A, to give a compound of Formula A³.

REACTION SCHEME IVIV. Preparation of Formula A Where R³ is Hydroxyl and n is 1

Referring to Reaction Scheme IV, in Step IV-A a compound of Formula 4 is halogenated, by contacting it with a halogenating agent, for example, thionyl halide, under conditions similar to those described in Step I-A, to give a compound of the Formula 8.

In Step IV-B, a compound of Formula 8 and a compound of Formula 3 are condensed by contacting them under conditions similar to those described for Step I-B, to give a compound of Formula 9.

In Step IV-C, a compound of Formula 9 is reduced, by contacting it with a reducing agent under conditions similar to those described for Step II-A to give a compound of Formula A⁴.

REACTION SCHEME V

V. Preparation of Formula A Where R³ is Lower Alkyl

Referring to Reaction Scheme V, in Step V-A, the Grignard reagent of a lower alkyl halide, the compound of Formula 11, is contacted with an imidazole compound of Formula 10 [obtained using the procedure of Cornforth and Huang, J. Chem. Soc., (1948), 731-735] in a neutral solvent (for example, diethyl ether, tetrahydrofuran, tetrahydropyran, and the like) and refluxed for between 15 minutes and 2 hours, preferably between 20 minutes and 40 minutes, and is then cooled and poured into ice water. The aqueous layer is extracted with a suitable organic solvent, such as diethyl ether. When the solvent is removed under reduced pressure, a residue is formed that can be recrystallized in ethanol yielding a compound of Formula 12.

In Step V-B, a compound of Formula 12 is halogenated under conditions similar to those described for Step I-A, to give a compound of Formula 13.

In Step V-C, a compound of Formula 13 and a compound of Formula 3 are contacted under conditions similar to those described for Step I-B, to give a compound of Formula A⁵.

REACTION SCHEME VI

Referring to Reaction Scheme VI, the nitrile of Formula 14 is dissolved in alcohol, preferably methanol or ethanol, more preferably 99% ethanol, the solution is saturated with dry HCl gas and stirred at room temperature for from 1 to 24 hours, preferably overnight. The precipitate (compound of Formula 15) is filtered, washed and dried. A second crop of precipitate is collected by placing the mother liquors in a freezer overnight, and the precipitate is washed and dried.

Compound of Formula 15 is added slowly with stirring to an alcohol, preferably methanol, which is saturated with ammonia. Once the compound is dissolved, it is stirred at room temperature for from 1 to 24 hours, preferably overnight. The solution is reduced by 2/3 volume under vacuum, then diluted with 3 times its volume with isopropylacetate. The precipitate formed (compound of Formula 16) is filtered and dried.

Compound of Formula 16 is then dissolved in alcohol, preferably methanol or ethanol, more preferably 99% ethanol. Compound of Formula 17 is added dropwise and the reaction mixture refluxed for 1 to 40 hours, preferably 15 to 25 hours, more preferably about 20 hours. The mixture is then cooled to 15 to 40 °C, preferably about 30 °C, compound of Formula 3 is added, then water, a base (such as sodium hydroxide, potassium hydroxide, sodium carbonate, sodium bicarbonate, potassium carbonate, potassium bicarbonate, and the like, preferably sodium hydroxide) and a metal hydride (such as lithium bromide, potassium bromide, preferably lithium bromide) are added. Any insoluble material is removed by filtration and the solution is refluxed for 1 to 10 hours, preferably 4 to 6 hours. The reaction mixture is cooled and stirred at room temperature for 1 to 24 hours, preferably overnight. The precipitate is filtered, then poured into an alcohol/water mixture (such as methanol/water, ethanol/water, isopropanol/water in a ratio of from 10:90 to about 90:10, preferably 60:40). The solution is warmed to 50 to 80 °C, preferably about 70 °C, for 15 minutes to 4 hours, preferably about 1 hour, then cooled, and the precipitate filtered and dried to yield compound of Formula A.

PREPARATION 1

Preparation of Compound of Formula 1

20 A solution of 1 mole (117.5 g) of toluenitrile in 500 ml absolute ethanol (99%) was saturated with dry HCl gas then kept under stirring at room temperature overnight. A first crop of crystals was collected by filtration then mother liquors were concentrated and placed in a freezer (-18° C) for 16 hours. A second crop was obtained, giving an overall yield of 80%. Without further purification, the crude product (160 g) was put in
25 200 ml NH₃-saturated methanol, portionwise with stirring. After complete dissolution the reaction medium was left at room temperature overnight then 1/3 of the methanol was removed under reduced pressure. The resulting solution was diluted with 200 ml of isopropyl- acetate and left to crystallize at room temperature for one day. The desired toluamidine hydrochloride was recovered by filtration, dried overnight at 50° C and used without further purification in the next step (77 g of a white powder, 90% yield).

30 77 g of the above benzamidine hydrochloride were dissolved in 200 ml of water then one equivalent of butanedione was added. The pH was adjusted to 7 with 2N sodium hydroxide and the reaction medium was left for two hours at 0° C. The white solid formed was filtered off and washed with acetone. The crude product (93 g) was dissolved in 500 ml of 10N HCl then the solution was heated to 100° C with stirring for 6 hours. After cooling, the white solid formed was recovered by filtration and recrystallized from water to give
35 65 g of 2-(4-methylphenyl)-5-methyl-4-hydroxymethyl-1H-imidazole, melting point, 167-169° C.

This 4-hydroxymethyl-1H-imidazole was then reacted with a thionyl halide using the procedures set forth above to form the 2-(4-methylphenyl)-4-chloromethyl-5-methyl-1H-imidazole hydrochloride used in Example 1.

The mixture was refluxed under stirring overnight. After cooling, the salts were removed by filtration and the solvent was removed under reduced pressure. The residue was extracted by dichloromethane and washed twice with water. The organic layer was dried over sodium sulfate and evaporated. Trituration of the residue with ethanol gave a white precipitate, 1-diphenylmethyl-4-[2-(2-phenyl-5-methyl-1H-imidazol-4-yl)-2-oxoethyl]piperazine, which was used in the next reaction step without further purification.

EXAMPLE 5

- 40 1-Diphenylmethyl-4-[2-(4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine and Derivatives Thereof

A. A solution of 4-methylbenzonitrile in 99% ethanol was saturated with 3 equivalents of dry HCl gas and the reaction mixture was stirred overnight. The precipitate which formed was filtered and the mother
 45 liquors were placed in a freezer at -18°C overnight. A second crop was obtained from the mother liquors. The combined crops were dried at 30°C overnight under vacuum, giving 78% yield of ethyl 4-methylbenzenecarboximidate hydrochloride (compound of Formula 15).

B. The product of step A was added portionwise with stirring to methanol which had been saturated with ammonia in the ratio of 1 liter methanol to 1 kilogram of product of step A. The product of step A
 50 dissolved slowly and the solution was stirred overnight. Two thirds of the volume was evaporated under vacuum. The remaining solution was diluted with three times its volume of isopropylacetate. The solution was filtered and dried overnight at 50°C to yield 4-methylbenzenecarboximidamide hydrochloride (compound of Formula 16) in 90% yield.

C. One mole of the product of step B was dissolved in 2 liters of 99% ethanol. 1.1 moles of butanedione were added dropwise, the solution was warmed to reflux and refluxed for 20 hours. The solution was
 55 allowed to cool to 30°C and 1 mole of powdered biphenylpiperazine was added portionwise. This was followed by the addition of 1 liter of water, 1.5 equivalents of sodium hydroxide (as 12N solution), and 1.1 equivalents of lithium bromide. The solution was filtered to remove insolubles and then refluxed for 5

hours. The solution was allowed to cool to room temperature and was stirred overnight. The precipitate which formed was filtered and the filter cake was added to an ethanol:water mixture (60:40) in the ratio of 3 liters of solvent mixture to 1 kilogram of filter cake. The solution was warmed to 70 °C for one hour and then allowed to cool to room temperature. The precipitate formed was filtered and dried overnight at 80 °C under vacuum to form 1-diphenylmethyl-4-[2-(-4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]-piperazine in 88% yield.

D. The trihydrochloride salt of the free base of the product of step C was formed by dissolving the free base of step C in 99% ethanol at the ratio of 1.1 liter of ethanol per mole of product. One mole of 1N HCl solution was slowly added. The solution was filtered and then warmed to 60 °C. With slow addition, 250 ml of 12N HCl solution were added. The solution was slowly cooled to -10 °C and the precipitate was filtered off and dried under vacuum at 100 °C for 48 hours to yield 1-diphenylmethyl-4-[2-(-4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine trichydrochloride, m.p. 204-205 °C.

EXAMPLE 6

Conversion of Free Compound To Salt

Trihydrochloride salt -

The hydrochloride salt was obtained by addition of hydrochloric acid to the free base of a compound of Formula A dissolved in ethanol or ether. See step D of Example 5.

Monohydrochloride salt -

100 g. of 1-diphenylmethyl-4-[2-(-4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine were dissolved in 300 ml of ethanol at 95 °C. To this solution 1 equivalent of 1N HCl was added with stirring. The reaction mixture was stirred at room temperature for 2 hours then the solvents were evaporated off under reduced pressure. The residue was dissolved in ether and the precipitate was filtered. The precipitate was recrystallized from isopropyl ether:acetone (1:1) to yield 1-diphenylmethyl-4-[2-(-4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine monohydrochloride, m.p. 186-188 °C with decomposition.

Monomaleate Salt -

5 g. (0.0115 mole) of 1-diphenylmethyl-4-[2-(-4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine were dissolved in 300 ml of ethanol at 95 °C. To this solution 1.34 g (0.0115 mole) of maleic acid was added with stirring. The reaction mixture was stirred at room temperature for 2 hours then the solvents were evaporated off under reduced pressure. The residue was dissolved in ether and the precipitate was filtered. The precipitate was recrystallized from isopropyl ether:acetone (1:1) to yield 1-diphenylmethyl-4-[2-(-4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine monomaleate, m.p. 164-166 °C with decomposition.

Trifumarate salt -

To 5 g. of 1-diphenylmethyl-4-[2-(-4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine (0.0115 mole) in acetone (100 ml) there was added 1.33 g. (0.0115 mole) of fumaric acid. The solution was heated to reflux, allowed to cool to room temperature, and allowed to stand at room temperature until precipitate formed. The precipitate was collected by filtration and recrystallized from ethanol to give the fumarate salt of 1-diphenylmethyl-4-[2-(-4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine, m.p. 195 °C in almost quantitative yield.

In a similar manner, all compounds of Formula A in free base form can be converted to the acid addition salts by treatment with the appropriate acid, for example, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, acetic acid, propionic acid, glycolic acid, pyruvic acid, oxalic acid, malonic acid, succinic acid, malic acid, maleic acid, tartaric acid, citric acid, lactic acid, benzoic acid, cinnamic acid, mandelic acid, methanesulfonic acid, ethanesulfonic acid, p-toluene- sulfonic acid, and the like.

EXAMPLE 7

Conversion of Salt to Free Base

20 g. of 1-diphenylmethyl-4-[2-(4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine trihydrochloride were solubilized in 200 ml of water. Sodium hydroxide (5N) was added dropwise with stirring until pH 8-9. The aqueous medium was extracted twice by 200 ml of dichloromethane. The organic phases were combined then washed with cold water until neutrality. Sodium sulfate was added to dry the organic phase, then the solvent was evaporated under reduced pressure. The resulting residue was crystallized from aqueous ethanol (90%) to give 1-diphenylmethyl-4-[2-(4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine.

If desired, the extraction phase can be eliminated to allow direct recovery of the product followed by recrystallization.

EXAMPLE 8**Conversion of one Salt to Another Salt**

15 5 g of 1-diphenylmethyl-4-[2-(4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine monofumarate were dissolved in 100 ml of hot ethanol. 3 ml of commercial concentrated HCl solution (10N) were added with stirring. The solution was refluxed for 30 minutes then the solution was allowed to cool to room temperature. The solvent was evaporated off and the residue was crystallized twice from ethanol at 98°C to yield 1-diphenylmethyl-4-[2-(4-methylphenyl)-5-methyl-1H-imidazol-4-yl)methyl]piperazine trihydrochloride, m.p. 202-204° with decomposition.

B. Ten minute Model of four vessel occlusion with 72 hour survival.

The procedure used was that of Alps, et al., *Neurology*, 37, 809 (1987). The object of this assay was to count abnormally appearing cells in 7 different areas and exymers as a percentage of the total area counted. The number of counts per structure depended upon size, e.g., cortical areas had double the number of other areas. Mean whole brain scores were also determined for percent abnormalities. Normal brains were also used to account for incidence of artifact changes attributed to the fixation process.

C. The effect of 1-diphenyl-methyl-4-[(2-(4-methylphenyl)-5-methylimidazol-4-yl)-methyl]piperazine

trihydrochloride on pentylenetetrazole-induced seizures and mortality in the mouse.

The procedure used was that described in Allely, and Alps, Br. J. Pharmacol. Proc. Suppl., 92, 605P (1987). Groups of 20 or more (see n in table) male CDI mice were predosed with 500 mg/kg i.p. of 1-diphenyl-methyl-4-[(2-(4-methylphenyl)-5-methylimidazol-4-yl)methyl]piperazine trihydrochloride at one of three dosing schedules - A (15 minutes), B (60 minutes), or C (3 days b.i.d. plus 15 minutes on 4th day) - before challenging with 100 mg/kg of pentylenetetrazole s.c. The animals were then observed for a 30 minute period and the occurrence of clonic or tonic seizures or death noted. Statistical analysis was by a Chi squared test of association. Results compared against saline treated animals are shown in the below table.

In an oral dose ranging study in rats of 1-diphenyl-methyl-4-[(2-(4-methylphenyl)-5-methylimidazol-4-yl)-methyl]piperazine trihydrochloride no death or clinical signs of toxicity were seen at up to 25 mg/kg/day.

30 EXAMPLE 17

Diuresis

Male normotensive rats weighing 290-380 g were divided into four groups of seven animals. All animals were fasted and deprived of water overnight. The following morning, each group of rats was hydrated with deionized water (20 mg/kg.p.o.) 45 minutes prior to the administration of vehicle (1% polysorbate 80 in deionized water) or 1-diphenyl-methyl-4-[(2-(4-methylphenyl)-5-methylimidazol-4-yl)methyl]piperazine trihydrochloride at doses of 5, 15, or 30 mg/kg p.o. Fifteen minutes post-drug, the animals were saline loaded (30 ml/kg, p.o. 0.9% sodium chloride) and placed individually in metabolism cages. Urine was collected at 1, 3, and 6 hour intervals post-dose. Urine volumes were measured and sodium and potassium levels were determined by flame photometry. Differences between control and treated values were evaluated by one way analysis of variance. 1-diphenyl-methyl-4-[(2-(4-methylphenyl)-5-methylimidazol-4-yl)-methyl]piperazine trihydrochloride (30 mg/kg, p.o.) produced significant ($p < .05$) diuresis which was observed at 1 hour and 6 hours post-drug. The compound (30 mg/kg, p.o.) elicited a significant natriuretic effect at the 3 and 6 hour time periods. No significant kaliuretic effects were observed following compound administration.

EXAMPLE 18**Irritable Bowel Syndrome**

The test used is a modification of the method of Macht and Barba-Gose, J. Amer. Pharm. Assoc., 20, 558 (1931), which traces the transit of a charcoal meal through the intestine as an index of transit time. In the present model, intestinal transit in conscious mice (15-20 g) was accelerated with an oral dose of barium chloride (300 mg/kg) administered at the same time as the charcoal meal. The animals were sacrificed 10 minutes later and the distance travelled by the charcoal measured. 1-diphenyl-methyl-4-[(2-(4-methylphenyl)-5-methylimidazol-4-yl)methyl]piperazine trihydrochloride was given as a 15 minute oral pre-treatment and its effect on non-stimulated or barium-stimulated intestinal transit of the charcoal meal was calculated. The results were expressed as inhibition percentage of the total transit induced by Ba⁺², and not as the inhibition percentage of the portion representing the Ba⁺² effect and are shown in the below table.

Dose 15 min mg/kg p.o.	% Change Ba ⁺²	% Inhibition of Ba ⁺² effect	% Inhibition Normal Transit
5	+ 93 %	+ 14 %	- 19.3 %
25	+ 93 %	- 30.4 %	- 28.7 %
60	+ 93 %	- 31.7 %	- 16.1 %

13. Verfahren zur Herstellung einer Verbindung der Formel A

Formel A

worin:
 R¹ Aryl ist;
 R² Aryl, Niederalkyl oder Wasserstoff ist;
 R³ Niederalkyl, Hydroxy oder Wasserstoff ist;
 R⁴ Aryl ist;
 R⁵ Aryl ist;
 m zwei oder drei ist;
 n null, eins oder zwei ist, mit der Maßgabe, daß wenn R³ Hydroxy ist, n eins oder zwei ist; und
 q null, eins, zwei oder drei ist;
 und der pharmazeutisch annehmbaren Salze davon, welches umfaßt
 (a) Kondensation einer Verbindung der Formel

worin n, R¹ und R² wie oben definiert sind, R³ Wasserstoff oder Niederalkyl ist und X ein Halogenatom darstellt,
 mit einer Verbindung der Formel

worin m, q, R⁴ und R⁵ wie oben definiert sind; oder

worin R¹, R², R⁴, R⁵, m und q wie oben definiert sind und n eins oder zwei ist,
um eine Verbindung der Formel A zu bilden, worin R³ Hydroxy ist;
oder
(c) Umsetzung einer Verbindung der Formel
